

The Five Steps to Safe Post-Anesthesia Recovery - a model for nursing care in the Post Anesthetic Care Unit

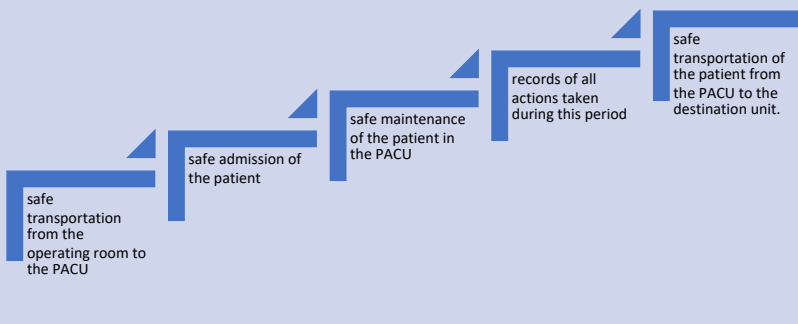

Authors: Debora C.S. Popov, SOBECC; Simone Batista Neto, SOBECC;; Ana Lúcia Gargione Galvão de Sant'Anna, SOBECC; Márcia Cristina Oliveira Pereira, SOBECC; Giovana Abrahão Araújo Moriya, SOBECC. Brazilian Perioperative Nursing Association - SOBECC

Background Information

The period that begins after surgery and anesthesia can be critical for the patient, and safety measures guarantee the success of the care provided to the patient. Therefore, proposing a model of nursing good practices in the Post-Anesthetic Care Unit -PACU, could have a positive impact on nursing actions, guaranteeing patient safety in the immediate post-operative period. SOBECC – Brazilian Perioperative Nursing Association - disseminates good practices in perioperative nursing throughout Brazil

PREPARATION AND PLANNING

In 2020, SOBECC proposed material based on the safe surgery checklist, specific to the PACU, including:

Objectives of Project

To propose a model of safe nursing care for patients, seeking the best practices in the PACU

Statement of Successful Practice

In Brazil, there is a shortage of material on nursing care in the PACU, so the material had a major impact on SOBECC's media, causing a large number of views and shares, with 10,990 impressions and 68,161 interactions: save, like and share!

IMPLICATIONS FOR PERIOPERATIVE NURSING

SOBECC has a responsibility to offer its members and nurses a condition for constant improvement, keeping the target of patient safety in focus, and guaranteeing safety in the immediate post-operative period. The launch of the material gave rise to the Anesthetic Process Nurses Committee, which at SOBECC works specifically for professionals in the perianesthesia area and their challenges.
